

Pros And Cons of Dental Crowns

Tooth injuries are some of the most treated tooth problems. An accidental blow to the mouth can damage the teeth severely. Also, poor dental hygiene can cause tooth decay, which can also damage the tooth. A patient with tooth injuries requires urgent dental care. To treat such injuries to the teeth, the dentist may prescribe several dental treatments.

Some common treatments for injured or damaged teeth are veneers, dental implants, [dental crowns, and bridges](#). Dental crowns are highly effective for treating the damaged tooth. They are cap-like structures used to reshape and restore a damaged tooth. Dental crowns offer users distinct benefits over its alternatives. But like most dental treatments, they also have their cons. This blog will discuss the pros and cons of dental crowns.

Pros Of Dental Crowns

Dental crowns are effective for treating tooth injuries, as they provide an adequate solution to several dental problems. They also offer several unique advantages over alternative treatments like dental bridge treatment. Some pros of using dental crowns include:

- They provide strong support for a severely damaged tooth
- They offer adequate protection from further damage to a worn-out tooth
- Dental crowns are used to protect the teeth after major surgical procedures like root canal procedure
- Dental crowns are used to hold severely broken or cracked teeth together
- They serve as protective covers for dental implants
- Dental implants are used to improve a tooth's appearance
- They can be used to reshape a tooth or change its color
- Dental crowns are durable and are a fantastic option for long-term usage.

The numerous advantages of dental crowns prove why many dentists prefer using them for damaged tooth treatment. In fact, scientific studies prove that dental crown treatments have a higher success rate than most dental restoration methods.

Cons Of Dental Crowns

Although dental crowns are great dental treatments, they also have their cons. These cons may be discouraging when critically analyzed. The cons of dental implants include:

- The tooth must be filed to fit into the crown.
- Unlike some dental treatments, dental crowns and bridges can be extremely painful.

- The changes made to the teeth are extensive and irreversible.
- After the procedure, some patients may still experience extreme discomfort.
- The crown may become chipped over time.
- Patients feel sensitivity to cold or hot substances after the procedure
- The dental cement for holding the crown may wash away, causing the crown to become loose or fall off.
- Some patients may experience allergic reactions to dental crowns.
- If the crown becomes loose, it exposes the teeth to infections.
- Dental crowns are pretty expensive.

The good side of using dental crowns is that most of its disadvantages can be rectified. This can also be counted as an advantage of using dental crowns.
