

Boost Cannabis Drying With These Tips

When drying cannabis, there are several variables to consider to have quality finished buds. However, this would first require time and patience. If one exercises patience while drying cannabis, the finished buds will be worth every minute of waiting. Also, quality drying equipment like **hanging racks** must be used during the drying process. This ensures that the cannabis is dried correctly. Here are a few tips to boost cannabis drying:

- Keep a low-temperature environment
- Pay attention to the drying practices
- Ensure maximum cleanliness

Keep A Low-Temperature Environment

As stated earlier, it is essential to use quality drying equipment like **hanging racks** when drying cannabis. However, it is necessary to keep the temperature low when drying cannabis. No matter how quality the equipment used is, if the temperature is not correct, the cannabis won't dry properly. This is because high temperature is a threat to cannabinoids and terpenes. It can lead to the evaporation of these compounds. Terpenes can even evaporate at room temperature or lower temperatures. It would be beneficial to keep the temperature at 15 to 16° C.

Pay Attention To The Drying Practices

When drying cannabis, it is essential to pay attention to the drying practices. This will help prevent things like rapid drying, ensuring the cannabis is dried correctly. For instance, when considering the drying room airflow, it is essential to focus on the room's air circulation of the room. By positioning fans correctly, an even airflow and distribution can be created. It is always essential to create an optimal environment for drying the cannabis in the room.

Also, ensure trimming starts prior to harvesting. It should be done before the flowering periods. Larger fan leaves should be cut, and the whole plant should be hung from a **marijuana hanging rack**. It is best to use drying racks to hang the cannabis instead of using trays. Trays should be used after wet-trimming. Other things to do for better cannabis dry include:

- Dry for seven to ten days
- Choose dry trimming over wet trimming
- Sweet the cannabis
- Transition the nugs into the optimal climate for cannabis

Ensure Maximum Cleanliness

Another tip for effective cannabis drying is ensuring maximum cleanliness. For instance, when drying cannabis, it is essential to wear gloves and maintain a clean environment. Also, use a clean **cannabis hanging rack** for storing the cannabis to prevent contamination. This would help prevent fungal and bacterial growth. Fungal and bacterial growth would make the cannabis moist, making it difficult to dry. It will also destroy the quality of the cannabis, making it unfit for usage. When collecting freshly harvested cannabis plant materials, ensure to use liners.

Do you need an effective solution for efficient cannabis drying? Do you want the best weed hanging racks for your cannabis drying processes? Contact us. We are a renowned custom fabricator and manufacturer of specialized heavy-duty stainless steel drying racks. We also specialize in manufacturing custom conveyor systems and heavy-duty harvesting and bucking machines.
