

Know Different Types of Embroidery Digitizing Options

The digitization of embroidery is transforming a craft that has been around for centuries into a new art form. Embroidery digitizing is accomplished using a computer program to create an embroidered pattern according to an image or logo file.

There are many variables and choices to consider when assessing and deciding what type of embroidery digitizing to use for your business. Let's take a look at the major types:

Flat Embroidery Digitizing:

Digitizing embroidery is a process that involves the application of stitching patterns directly onto fabric backing. One technique is called flat embroidery digitizing, which creates intricate designs without distorting the image or logo. This technique is popular for embellishment because it creates sophisticated and detailed designs without flashiness.

3D PUFF Embroidery:

3D puff embroidery digitizing is used to create designs that are more three-dimensional. The process involves placing a layer of foam under the stitching so that it will puff up and stand out. Puff embroidery digitizing is ideal for designs without any complexities, such as initials and alphabets. It's also perfect for bolder and bigger designs that are supposed to stand out, like company logos.

Applique Embroidery Digitizing:

Applique digitizing is an embroidery technique used to create elaborate designs on garments or decorative badges. The technique involves attaching patches of fabric to a base piece and then sewing the patches together. If you want to personalize your design, this method will help you create something unique and beautiful. Applique digitizing is mainly used for quilting and banner-making processes as well as for decorations on garments.

Chain Stitch Embroidery:

Chain stitch digitizing is best suited to creating designs with chain-like patterns. This technique can be laborious and challenging, but the results are usually worth it. It uses a lot of thread, but digitizing chain stitching ensures that the patterns are perfect in source images/designs.

Photo Digitizing:

Photo embroidery digitizing is a method of sewing that resembles an artist's work on canvas. It includes stitching made with multilayered colors that gives your design volume and color modulation. A photo stitch digitized design has some distinct features—namely, it can be large in size and may include a large number of stitches.

Choosing the right embroidery digitizing can be a difficult decision. But no worry! Our team is ready to help you. We're just a few clicks away, and we'll gladly explain the differences between all of our digitizing options. For the [best embroidery digitizing service](#), call BETOP Embroidery Factory now!
